Asperger's Syndrome (AS) is an Autism-related condition. People with AS can be of above-average intelligence but think differently, leaving them at a disadvantage in social situations. They need routine, and may become distressed when their routine is disrupted. Often having one or more heightened senses, they're more sensitive to changes from their normal environment, again causing reactions of distress. AS symptoms, which often include not making eye contact, and difficulty in making and reading facial expressions appropriately, can vary widely between individuals with AS. When interacting with someone with Aspergers, it is advisable to let them answer in their own words. More info. at **www.aspergerinfo.com/knowmore**

Persons with AS, particularly when distressed, may not answer "yes/no" questions correctly. Please identify and remove the cause of their distress if possible, or guide them, with minimal physical contact, to a quiet place. Isolation often assists in recovery. *Raised voices, attempts to make eye contact, and threatening behavior will escalate their distress*, resulting in a range of possible reactions, including backing away, placing hands over the ears, breaking eye contact or involuntarily lashing out, either verbally or physically. POLICE OFFICERS AND SECURITY AGENTS: When dealing with a person with Asperger's Syndrome who is exhibiting signs of distress as detailed above, please use appropriate de-escalating strategies: lowered voices, non-threatening behaviors, minimal physical contact and isolation in a low stimulus environment.
